# SKU Landed Cost - Screen Guide

Containers › SKU Landed Cost. Each control on the screen and what it does.

## Top of the screen

### Opex for the month

This month's warehouse overhead total and its rate per CBM, by country (Canada / USA).

### Warehouse overhead

Set each month's overhead per warehouse. It is spread over SKUs by CBM per piece. A default is recorded automatically for each month that ends.

### Map expense columns

Tie container L4 expenses to the cost columns. L4s already mapped on another screen show as taken, so nothing is counted twice.

## Filters

### Search

Find a SKU by its code, product name or UPC.

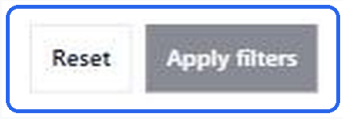

### As of (one date)

Costs as they stood at the end of one chosen day. Picks a single day only, not a range.

### Live today, snapshot before

Today is worked out live; earlier days come from the snapshot taken that night.

### Apply / Reset

Filter changes wait for Apply, and a pill shows what isn't applied yet. Reset goes back to today.

## Table columns

One row per SKU. Headers are single cells, grouped under Shipment and Warehouse overhead.

**SKU**
Code, product name and CBM per piece.

**Landed cost**
Cost per unit from containers in transit or delivered, in CAD and USD.

**Shipment**
Cost per unit to ship into Walmart WFS and Amazon FBA.

**Warehouse overhead**
Overhead per unit for the Canada and USA warehouses (3PL).

## What we built

- **Landed cost per SKU** from every container in transit or delivered, in CAD and USD, with WFS / FBA shipment cost.
- **Warehouse overhead and 3PL mapping**, spread over SKUs by CBM and shown per unit for Canada and USA.
- **Expense mapping** of container L4s to cost columns, with L4s taken elsewhere blocked.
- **As of a day**: live for today, nightly snapshot for earlier days.
- **Cleaner table**: one row per SKU and single-cell headers.
- **This release:** users ahead of the business timezone (Los Angeles) no longer get "Pick a date up to today" and an empty table; a date past the business day counts as today. The As of calendar now shows one month and picks one day.
